TITLE: On the Salt Effect in Deuteron Exchange in Liquid Ammonia
(O solevom effekte pri deyteroobmene v zhidkem ammiake)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 124, Nr 1, pp 146-149
(USSR)

ABSTRACT: The salt effect in deuteron exchange has hitherto hardly been investigated at all. A suitable means of investigating it is liquid ammonia, because it has a low dielectric constant and because it is a good solvent for numerous organic substances and salts. The characteristic features of the influence exercised by salts on the kinetics of the dissolution of lactones, ethers, and halide compounds have already been determined (Ref 1), and the results obtained were also confirmed by other authors. Neutral salts accelerate these reactions all the more, the higher the charge and the smaller the radius of the ions. ($\text{Ca}^{++} > \text{Sr}^{++} > \text{Ba}^{++}$; $\text{Li}^+ > \text{Na}^+$; $\text{Cl}^- > \text{Br}^- > \text{NO}_3^- > \text{J}^- > \text{ClO}_4^-$). The energy E and the entropy ΔS^* of activation are increased. The authors assume that the rules

Card 1/4

On the Salt Effect in Deuteron Exchange in
Liquid Ammonia

SOV/20-124-1-41/69

governing the salt effect in electron exchange and in solvolytic reactions in liquid ammonia are similar to each other. Provisional experiments were carried out with indene and acetophenone, and also systematic experiments were carried out with methyl- β -naphthyl-ketone. 0.2 g of this substance were dissolved in ~2.5 g ammonia in the presence of a carefully dried salt. The concentration of the salt was ~2.5n, and frequently different salt preparations were used. The experiments carried out without salt lasted 0.5 - 2 hours, but those with salt lasted half an hour. The experiments carried out for the purpose of determining activation energy and activation entropy were carried out with methyl- β -naphthyl-ketone, which was partly deuterized in the methyl group. The authors further investigated the manner in which the equilibrium of the production of the colored complexes of 3,5 dinitrobenzoic acid (I) and phenolphthalein (II) with ammonia shifts in the case of the addition of salts. Also the results obtained by kinetic measurements carried out in the case of the presence of 2.5 n ammonium salts are given. The reactions of deuteron exchange are accelerated by salts,

Card 2/4

On the Salt Effect in Deuteron Exchange in
Liquid Ammonia

SOV/20-124-1-41/69

and, in general, such series of anions and cations continue to hold as have already been found previously in reactions of dissolution in ammonia. Similar series of anions and cations were found also by measuring the equilibrium shift of complex formation. The problem is then investigated as to how the parameters of the Arrhenius equation vary by the addition of a salt. The here discussed deliberations agree well with the rules governing the salt effect in the reactions of deuteron exchange and ammonolysis in liquid ammonia, and they also explain their common features. Further investigations will contribute towards interpreting the phenomena discussed here. The authors thank Corresponding Member, AS USSR, Ya. K. Syrkin and Professor M. B. Neyman for discussions. There are 5 tables and 12 references, 9 of which are Soviet.

Title : The Determination of the Specific Surface According to
the Sudan R Sorption Method.

Orig Pub : Chem. listy. 1957, 51, No 8, 1429-1434

Abstract : A rapid method for determining the specific surface
(S) of powderlike and granulated sorbants by the ad-
sorption of G Sudan R (2-anisol-azo-B-naphthol) from
non-polar solvents (toluene). Starting with the S
value $100 \text{ m}^2/\text{g}$ determined by stearic acid adsorp-
tion, the authors found that $S = G(0.166 \pm 0.013)\text{m}^2/\text{g}$
(G being expressed in mg/g), for 52 catalysts (ZnO ,
 MgO , Al_2O_3 , activated charcoal, aluminosilicate). When
 $S > 100 \text{ m}^2/\text{g}$, the method has only a limited value.

TITLE: On a Method of Calculating Fuel Evaporation //

PERIODICAL: V kn.: Dvigateli vnutrennogo sgoraniya. Moscow, Mashgiz, 1954,
pp 20-34

ABSTRACT: The author calculates the evaporation of fuel droplets in internal combustion engines with ignition by compression. The calculation method is based on the assumption of equilibrium isothermal evaporation and on the hypothesis of the non-uniform warm-up of the fuel droplets (along their radius). It gives results which correspond to the experimental results better than previous calculations carried out under the assumption of uniform warm-up of the droplets. In addition to calculating the equilibrium temperature of the droplet and the time needed for its full and partial warm-up, the author analyzes the possibility of applying the recommended method to the calculation of the evaporation of the fuel jet. He adopts the conventional distribution of droplets, obeying the law

Card 1/2

$$\Omega = e^{-\xi^2}, \text{ where } \xi = x/x_0 \text{ is the relative diameter of the}$$

W

67617

On a Method of Calculating Fuel Evaporation

SOV/124-59-4-3973

droplet, $n = 3-4$ is the characteristic of distribution, Ω is the volume part of the droplets that have a diameter larger than x ; as the "characteristic dimension" the author takes the diameter x_0 , for which $\Omega = e^{-1}$. It is shown that the quantities n and x_0 can be assumed to be constants when solving the problem. From the given examples it follows that: the time of evaporation is approximately proportional to the average temperature of dispersion; an increase of the degree of compression reduces the time of evaporation (the positive effect of the increase of temperature is stronger than the negative effect of the increase of pressure); the great non-uniformity of the spectrum of spraying, which leads to an increase of the rate of evaporation in the initial process, leads to an increase of the duration of the entire process.

Card 1/11

Internal Combustion Engines. v.1: Working Processes (Cont.) 326

COVERAGE: The authors give a brief historical survey of internal combustion engine development in the USSR and mentions the names of the principal designers and engine types built from 1901 to the present. Theoretical bases of contemporary engine cycles, combustion, intake, supercharging processes, fuel supply and engine control are discussed. The influences of the operational and design factors on the work of the engine are analyzed. Problems of power, efficiency, carburetion, transportation engine characteristics, and the bases of mixture formation in compression ignition engines and gas engines are discussed.

This book is a revised and enlarged edition of Dvigateli vnutrennego sgoraniya (Internal Combustion engines) Vol. I (Mashgiz, 1951). Particularly extensive revisions were made on Chapters III, V and IX. Chapters IV and VII have been rewritten. Chapters I and VII were written by Orlin, A.S.; Chapters II and IV by Vyrubov, D.N.; Chapter III by Vyrubov, D.N. and Leonov, O.B.; Chapter V by Vyrubov, D.N. (Sections 1-7),

REPORTS

Charomskiy, A.D. [Doctor of Technical Sciences, Professor]. Some Problems in the Further Development of Soviet High-speed Diesels

7

The author discusses four-stroke and two-stroke locomotive and marine diesel engines. Information on design improvements and new models is given. The conclusions of the author are summarized at the end of the article.

Card 2/8

Increasing the Output (Cont.)

SOV/3049

Orlin, A.S. The Problem of the Development of Layouts for Two-stroke Engines
and Computations of Gas Exchange

21

The author analyzes the layouts of two-stroke engines in current use and designs for the arrangement of gas exchange. Methods of computing gas-exchange processes are surveyed. Attention is given to the problems of efficient scavenging and better layouts of gas-distribution mechanisms. Results of an analysis of the gas-distribution process in a YaAZ-204 engine are presented.

Vyrubov, D.N. [Doctor of Technical Sciences, Professor, MVTU imeni Bauman].
Problems of Mixture Formation in Compression-ignition Engines

37

The author analyzes the problem of power output and discusses methods of obtaining most efficient combustion. Effects of cooling media and problems associated with fuel injection are also surveyed.

Malashkin, O.M. [Candidate of Technical Sciences, NATI]. The Question of
Using Two-stroke Cycles for Tractor Diesel Engines

47

The author compares some typical tractor engines and classifies them according to the method of producing scavenge air. Some typical schemes

The article reviews recent achievements in reducing fuel consumption in such diesel engines.

Simakov, F.F. [Candidate of Technical Sciences, Docent, MVFU imeni Bauman]. Maximum Possible Revolutions of a Four-stroke Engine

105

The author surveys some structural possibilities of increasing the r.p.m. coefficient and discusses the effects of the size of inlet nozzle upon the capacity of the engine. Some information is given on gas penetration and methods of computing it.

Simson, A.E. [Candidate of Technical Sciences, Khar'kovskiy zavod transportnogo mashinostroyeniya imeni V.A. Malysheva (Khar'kov Transport Machine-building Plant imeni V.A. Malysheva)]. Steps Being Taken in the Development of Gas-turbine Supercharging in Two-stroke Engines for Diesel Locomotives 123

The author discusses the problem of supercharging in 2D100 engines, mass-produced at this plant. After analyzing some of the systems using superchargers driven by exhaust-gas turbines, he concludes that the most

Card 5/8

Increasing the Output (Cont.)

SOV/3049

efficient and economical method of utilizing exhaust gas is by combining the kinetic energy of the air (transformed into pressure as it leaves the blower wheel) with variable pressure in the outlet. Tests have shown that fuel consumption in this type of engine is 150 to 155 grams per effective-horsepower hour.

Chursin, M.M. [Doctor of Technical Sciences, MVTU imeni Baumana]. Generalized Characteristics of Turbopiston Engines

138

The author analyzes factors affecting the performance of turbopiston engines. Indicator efficiency is computed, and methods of determining performance coefficients are stated.

Dmitriyevskiy, A.V. [Engineer, NAMI]. Double Exhaust as a Device for Increasing Coefficients of Power Output and Economy in Piston Engines

154

The author analyzes discharge coefficients for a four-stroke carburetor engine with the flow of gases through both the exhaust valves and the ports in the lower end of the cylinder. Comparison is made between DN engines, designed for double exhaust, and the standard "Moskvich-402" engine. The author concludes that double exhaust saves 20 percent more fuel.

TITLE: Future development of piston and combined internal combustion engines

SOURCE: Vestnik nauchno-tekhnicheskogo obrazovaniya, no. 4, 1987.

TOPIC: Internal combustion engine; piston and combined

ABSTRACT: Analysis of future development of power combustion engines and, in particular, diesel, also will play a significant role in the next few decades. The authors discuss the most important areas of development (with emphasis on the diesel). These include: increasing reliability and engine life by systematic improvement of basic processes and working procedures and metal castings; by decreasing heat losses; increasing use of gas energy; by combustion processes; development of closed cycle engines (mainly for maritime

O

applications); investigation of new geometries, including cylinder number and distribution, new compression geometries, etc; increasing engine power by supercharging and higher speed operation; improving automatic engine control for optimum operating conditions; development of gas compressors and expanded use of gas engines in industry and agriculture. The present state of the art is discussed as follows: 1) Low-speed diesels with turbo supercharging have been built with cylinders of up to 930 mm in diameter and up to 30 000 hp in a single engine. Fuel consumption is about 140 g/hp-hr and low speed (125-130 rpm) and low mep(10-11 kg/cm²) provides operation of up to 30 000 hours between major maintenance. 2) Medium speed engines: 400-700 rpm, 10-15 000 hp, cylinder diameter 350-500 mm, mep = 10-12 kg/cm², fuel flow 150-160 g/hp-hr. 3) High speed: 800-1500 rpm, 5000-7000 hp, 150-400 mm diameter, mep = 12-15 and higher, 150-160 g/hp-hr. 4) Lightweight turbine-piston diesels for transport (1500-2000 rpm and higher) are being developed by Rolls-Royce, G.M., and others. Although better performance is obtained by mechanically linking the piston engine and turbocharger, the optimum use of turbines and compressors with piston engines is still a matter for discussion. 5) High-speed automobile and truck engines have been highly developed, particularly by Rolls-Royce, G.M., and Lycoming (G.M. "Continental": 700-750 hp, 2400 rpm, 146 mm piston); their multi-fuel operating capabilities make them very

Title : ~~Economical conditions for transformer operations~~

Periodical : Energ. byul., #7, 20-22, Jl 1954

Abstract : The increase of transformer losses with the time of service is discussed. Graphical and analytical determination of losses are presented and specific losses related to the maximum loads are presented for computation in the form of curves. Chart, two tables, three numerical examples and two Russian references (1946 and 1953).

VYSHINSKIY, A.M.

The effect of fertilizers on some biochemical properties and yield of lupines poor in alkaloids. A. M. Vyshinskiy, M. P. Zukovskaya, and Yu. B. Lysyl. Nauch. Trudy Ukr. Nauč.-Izdatelstv. Inst. Selsk. Zemledelija - 7, 132-42 (1954); Referat. Zhur. Khim., Biol. Khim. 1955, No. 6753.— A study was made of the effects of K, P + K, N + P + K, and P + K + B on the no. of seeds and their N, P + K, and alkaloid contents in Veklo variety. With any of the fertilizer formulas used, P and N accumulated mostly in the fruits (as compared with the straw) towards the end of the period of growth. P + K + B increased the bulk of the crop but reduced the alkaloid content. These effects were reversed with N-type fertilizer. B. S. Levine (2)

EtOH, the mixt. treated dropwise with 0.023 mole alkyl halide, refluxed 3 hrs., the EtOH distd. off, the residue dried with 30 ml. CaH_2 , filtered, and the filtrate distd. Alkyls, yields in %, b_1 , n_D^{20} and m. ps. of the plerates (or dipicrolonates) are given: Plerates: Me, 118, 1.5630; 124; Et, 62, 123, 1.5529; 95; Pr, 73, 128, 1.5610, 130; iso-Pr, 68, 127, 92; Bu, 69, 142, 1.4908; P2; iso-Bu, 64, 138, 1.4901; 140, 1.4977; hexyl, 72, 148, 1.4981; 82; cyclohexyl, 68, 145, 1.4965; 154; PCH_2 , 92, 175, 1.5019; 119. Picrolonates: MeCH_2CH_2 , 71, 142, 1.5413, 100; $\text{EtNC}_2\text{CH}_2\text{CH}_2$, 74, 153, 1.5551, 163; $\text{Me}_2\text{NCHMeCH}_2$, 78, 155, 1.5297; 191; $\text{Et}_2\text{NCHMeCH}_2$, 72, 168, 1.4632, 169. The plerates and picrolonates were crystd. from EtOH-Me₂CO. 2-Hydroxyethyl nicotinate (20 g.) treated in 100 ml. CHCl₃ with 30 ml. SOCl₂ in 50 ml. CHCl₃ gave HCl salt of 2-chloroethyl nicotinate, m. 108° (from Me₂CO), which gave by alkalization with Na₂CO₃ and extn. with CaH_2 , 25.8 g. (80%) 2-chloroethyl nicotinate (I), b_1 , 128-30°, m. 29°, n_D^{20} 1.5301. I (9.38 g.) dissolved in 70 ml. CaH_2 was added to a soln. prep'd. by refluxing 8 hrs. 5.5 g. 3-pyridylcarbinol with 1.15 Na dust in 350 ml. CaH_2 , the mixt. was refluxed 6 hrs., the NaCl filtered off, and the filtrate distd. to give 0.5 g. (60%) 2-(α -picolyl)ethyl nicotinate, b_1 101-3°, b_4 155°, n_D^{20} 1.4991; dipicrolonate, m. 181°. All compds. were tested for their peripheral vasodilating, and some for their antihistaminic and spasmyolytic activities. M. Hudlicky.

Thiocyanatoylesters of nicotinic acid.

Zelenký, Vojtěch Trávník and Václava Výstavová

Ústav farm. biochem., Prácheň, České Budějovice

(Czechoslovakia)

(1971), *J. C. S. 49, 6051*. The reactions of KSCN with

alkylene oxides, and of KSCN with alkylenechlorohydriins

yielded a series of thiocyanatoalcohols, which reacted with

nicotinoyl chloride (1) to give the corresponding *o*-thiocyanatoethyl isomers. Their toxicity and effect on blood

pressure were investigated. $\text{HOCH}_2\text{CH}_2\text{SCN}$ and $\text{MeCH}_2\text{SCN}(\text{CH}_2)_3\text{CH}_3$, respectively, were prep'd by treating the oxides

with an excess amount of KSCN, the other thiocyanatoalcohols

by refluxing a mixt. of 0.05 mole chlorohydriin, 0.06 mole

KSCN, and 12 ml. EtOH 6 hrs. at 100-5°, dig. with 30 ml.

Et₂O, filtering off the KCl, drying the filtrate with Na_2SO_4 ,

passing the soln. through a 10 cm. column of Wołfitite M,

stripping off the solvent, adding 0.5 g. hydroquinone, and

dig. in *siccata*. Mixing 0.05 mol. thiocyanatoalcohol in 30

ml. Et₂O with a soln. contg. 7.1 g. I + 25 ml. C₆H₆, refluxing

the mixt. 30 min., collecting the deposited crystal. of the

ester hydrochloride, dissolving them in 10-15 ml. H₂O, acidified with 2 ml. HCl, washing the soln. with 25 ml. Et₂O, alkalinizing the aq. layer with 20% Na₂CO₃, estg. the ester with ether, and diag., the ext. yielded the *meristic esters* of the corresponding thiocyanatoxydines (the starting *o*-thiocyanatobenzoic acids, its % yield, b.p., and m.p. the % yield, b.p. and m.p. of the ester; and the m.p. of the picrate of the ester given): -NCSCH₂CH₂COOH, 65, b. 1112-13°, 1.5118, 80, —, — (ester, m. 77°); NCSCH₂COOH, 63, b. 93°, 1.4941, 68 (ester, m. 44°), b. 182°, 1.5198, 79°; MeCH₂SCNCH₂COOH, 48, b. 120-2°, 1.6050; 77° b.p., b.p. 140°, 1.6470, 104°; NCS(CH₂)₃COOH, 60, b. 128-9°, 1.5004, 64, b. 190°, 1.5431, 74°; NCS(CH₂)₂COOH, 53, b. 124-5°, 1.4938, 62, —, 1.5420, 151°; NCS(CH₂)₄COOH, 78, b. 135-6°, 1.4933, 69, —, 1.5410, 78°. XI. Basic ethers of 3-pyridylcarbinol. *Ibid.* 1221-4.—3-Pyridylcarbinol (b. 02-4°, n_D²⁰ 1.6356) (2.2 g.) dissolved in 30 ml. C₆H₆ was added at 70° to 0.40 g. Na covered with 150 ml. C₆H₆, the mixt. was stirred 3 hrs., the Na salt, sepd., washed with C₆H₆, suspended in 150 ml. C₆H₆, and treated with 0.022 mole of ambarakisil chloride in 30 ml. C₆H₆, the mixt. refluxed 14

J. J. FISHER & J. V. E. DELFR
hr., filtered from NaCl and dried, *in vacuo*. The following
3-pyridylmethyl nido-substituted alkyl ethers were prepared:
(% yield, b.p., and ν_{max} given): CH₃C₆H₅NMe, 68, b 103°,
1.5000; CH₃CH₂NH₂, 73, b 100°, 1.5022; CH₃CHMe-
NMe, 75, b 110°, 1.5023; CH₃CHMeNR₂, 60, b 116°,
1.5040; CH₃CH₂NC₆H₅, 68, b 1.5023; CH₃CH₂R (R =
morpholinio), 62, b 128°, 1.5100. These ethers lower the
blood pressure less than their 8 analogs and their toxicity is
lower. Antihistaminic and anticonvulsive effect is much
weaker than with the derived config. a benzene ring fused
of the pyridine ring. M. Huskley
